Tuning changes up or down made easily and electronically

CONTACT: Sonic8 PHONE: 0330 202 0160 WEB: www.morpheusefx.com

The Bomber combines features from Morpheus' DropTune and Capo polyphonic pitch-shifter pedals, and adds a treadle. Tuning changes differ to other Morpheus models, spanning five fixed intervals below normal pitch and four above, plus octave or two octave options in either direction.

The curvy metal casing incorporates a large illuminated display that indicates the chosen tuning. LEDs monitor all-important input volume, which is regulated by a rear-mounted level pot. It's accompanied by input and output jacks, plus a USB port to download software updates from the company's

website. Footswitches govern effect on/off and pitch change choice, while the treadle bends the pitch up or down from standard tuning to the pre-selected interval.

Sounds

The Bomber delivers realistic results on chords and singlenote work, without incurring any major changes to tone. Accurate tracking and minimal signal delay ensure any aural glitches affect only the more extreme pitch variations, and only then mainly when played clean and heard in isolation. The treadle provides smooth glissandos for anything from small pitch wobbles to gimmicky dive bombing or sky-high sweeps.

Verdict

A very viable rival to DigiTech's Whammy pedal, offering excellent and effective performance, plus easy operation, all in a stylish and stageworthy package. [PD]

Blue Yeti Pro £209

A mic that's far from abominable

USB mics can be convenient, incorporating microphone, preamp and A/D converters in the same package - you just plug them into your computer and get on with recording. The other side of the coin, though, is that you're getting fewer options than with a separate mic and audio interface and possibly less quality in the case of a budget USB mic. Blue's new Yeti Pro, however, ought to show none of the downsides as it offers high-quality A/D conversion with 24-bit/192 kHz digital recording resolution via USB and also has an analogue XLR output so you can use a separate preamp/ audio interface route to your computer if you wish.

In Use

Looking like a miniature R2D2, the Yeti Pro can sit by your computer on its robust stand and swivel through a range of angles for recording, but is equally at home on a conventional mic stand. Four selectable pickup patterns cardioid, omni, stereo and figure-of-eight - courtesy of the mic's three condenser capsules enable it to tackle a wide variety of recording tasks such as an ensemble performance in stereo, backing singers clustered around it, and everyday vocal and acoustic guitar duties. The captured sound is full-bodied, clear and precise and the inbuilt headphone monitoring system offers zero-latency

monitoring with instant control over the volume level.

Verdict

It might not be the most affordable unit out there, but desktop USB mics don't get much better than this. [TC]

The Bottom Line

We like: Quality sound; multiple pickup patterns; solid desk stand; mute switch We dislike: Not much

Fishman Fission Bass Powerchord FX £349

Mini bass orchestra at the touch of abutton (or two)

CONTACT: JHS PHONE: 01132 865381 WEB: www.fishman.com

This is a seemingly complex bass pedal that, as the name suggests, allows the stacking of notes in a chordal fashion with the introduction of fourth and fifth interval notes produced from the root. There is also the option to add the upper octave and, although it may sound complicated, it's easy and logical to operate so you can enjoy the effect without having to fathom out how to do it.

Chord building (harmony) from a single note has proved to be highly effective on both guitar and vocal systems, but just how useful it will become for bass is rather up to the

imagination of the player. Solidly built and well presented, note tracking is fast and accurate and two jack sockets provide the option of sending a mixed signal of bass and effect or just the effected sound.

Sounds

There's a huge area of sound generated from this modestly proportioned unit and it's so different we feel that its potential has yet to be fully appreciated. While you can introduce a higher octave, there's no facility to bring out the lower one so this is definitely not an octavider in

the regular sense. Add in some overdrive and the sounds just get bigger - this is ideal to fill the gap in a power trio when the lead guitarist takes a solo. With noise gate, tone control and effect level, studio friendliness is guaranteed.

Verdict

A very useful tool indeed, and a new sound for the bass guitar. Add to that Fishman's renowned quality and this is one to check out. [RN]

The Bottom Line

We like: Build quality: expansive chordal ability; unique sounds

We dislike: Won't do an octave below the root

Harmonic Design Super Chrome \$100

A P-90-style single-coil for your Telecaster... without routing

CONTACT: Harmonic Design PHONE: N/A WEB: www.harmonicdesign.net

As evidenced by the popularity of Fender's Vintage Hot Rod'52 model with its mini humbucker. there are plenty of players who favour the idea of a pickup with a little more wallop in their Telecaster's neck position. Perhaps the obvious choice, while still maintaining the Telecaster's single-coil character would be a P-90-style single-coil. However, like the mini humbucker, a soapbar or dog-ear single-coil would need a bigger body rout than found in a standard Tele and it's quite likely that few would want to make such an unkind cut to a favourite guitar.

No, what would really be great would be if someone

invented a P-90-styled pickup that could slot in as a direct replacement for the existing chrome Tele neck pickup. And that's exactly why Harmonic Design has come up with the Super Chrome: a small P-90 in a chrome Tele cover. Perfect!

Sounds

Installing the Super Chrome in our Telecaster, replacing the stock Fender unit, the difference is immediately apparent in the pickup's higher output. But the tone, still distinctly single-coil with top end clarity, has a richer bass and more midrange warmth without getting at all muddy. Nicely responsive too - a useful

tonal complement to the distinctive Tele bridge twang.

Verdict

If you want a bigger sound from a Tele's neck pickup without getting the tools out, try this. We're glad we did. [TC]

The Bottom Line

We like: No routing needed; P-90 sound from a Tele We dislike: Nothing
